Experiment 14: Password Testing Using Hydra in Kali Linux

Aim

To understand the use of THC Hydra in Kali Linux for testing the strength of login passwords on an authorized lab system.

Procedure

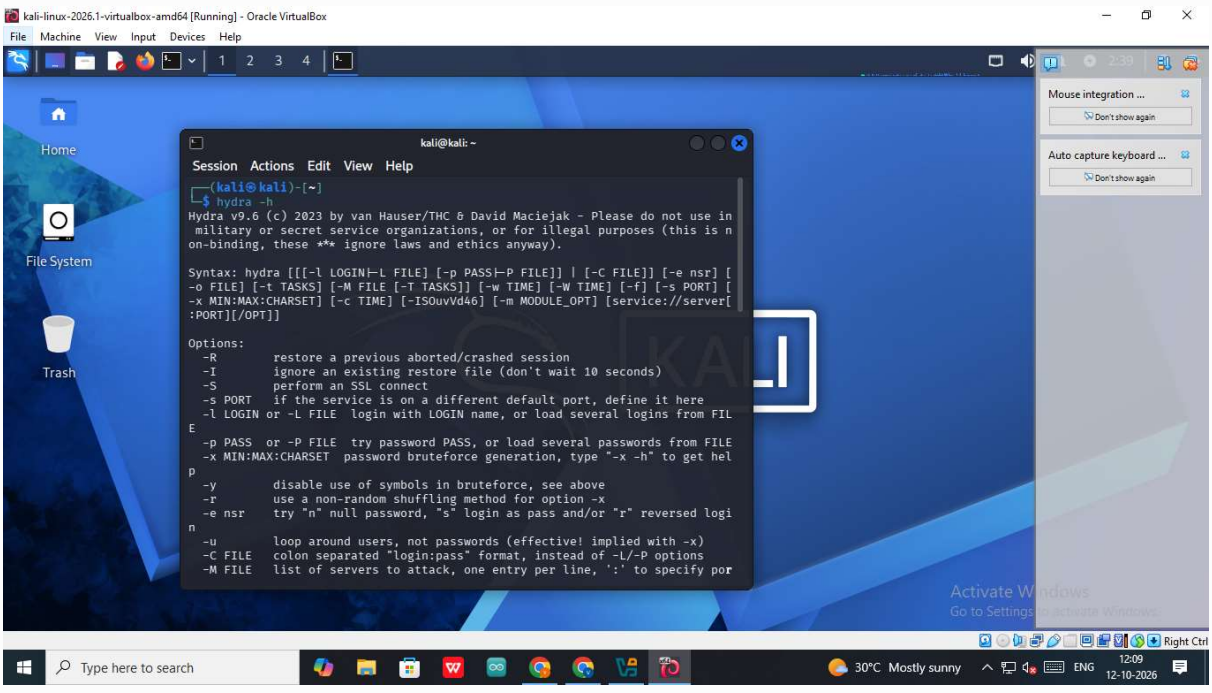

1. Open the Kali Linux terminal.
2. Check whether Hydra is installed.
3. Set up a local practice environment or use an instructor-authorized test service.
4. Prepare a test username and a small password list.
5. Run Hydra only against the authorized test account and service.
6. Observe the output and record the result.

3. Code

Sample Input 1

```
hydra -h
```

Sample Output 1:

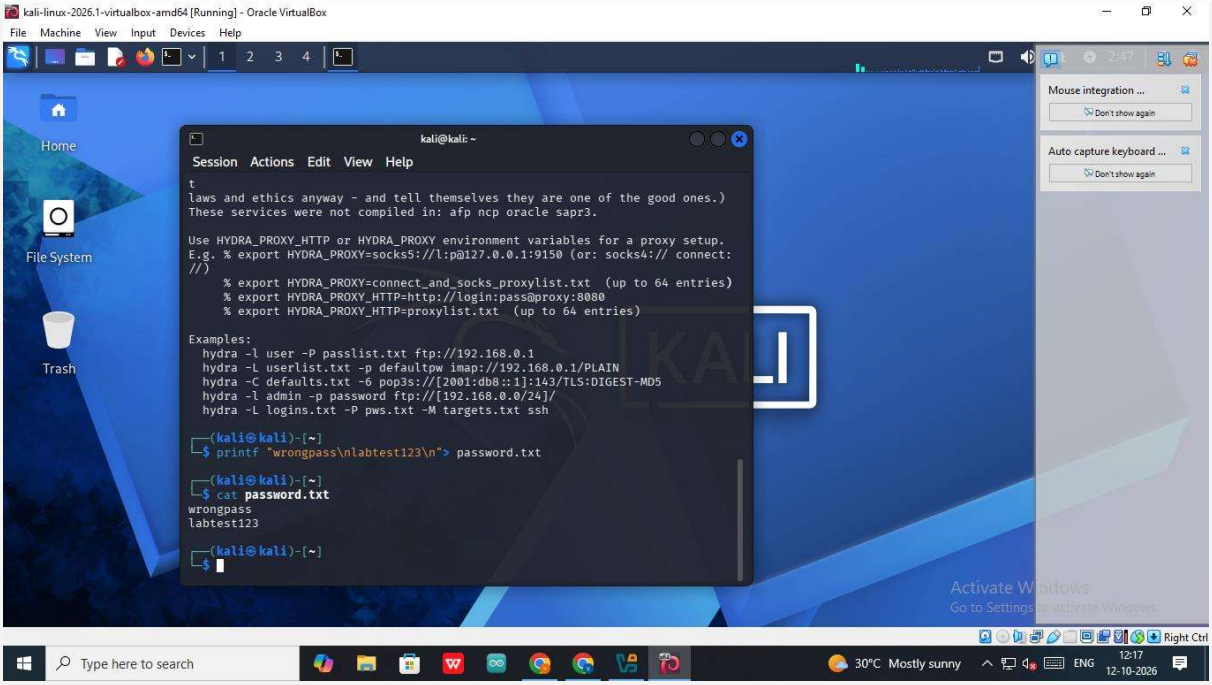

Prepare a sample password list

```
printf "wrongpass\nLabTest123\n" > passwords.txt
```

Sample Input 2

```
cat passwords.txt
```

Sample Output 2

Result

The Hydra tool was introduced, its availability was checked, and a sample password list was created in Kali Linux. Hydra is used in authorized security testing to assess login-password strength and identify weak credentials.
