Experiment 16: Use Google & WHO.IS for Reconnaissance

Aim

To perform reconnaissance using Google Search and WHO.IS to collect publicly available information about a domain, including indexed web pages, domain registration details, and nameservers.

Procedure

1. Start Kali Linux in VirtualBox.
2. Open the terminal and execute the `whois` command to obtain domain registration details.
3. Open Firefox and visit Google Search.
4. Enter the Google search operator `site:example.com` in the search box.
5. Open WHO.IS in the browser and search for `example.com`.
6. Observe the results and record the information obtained.

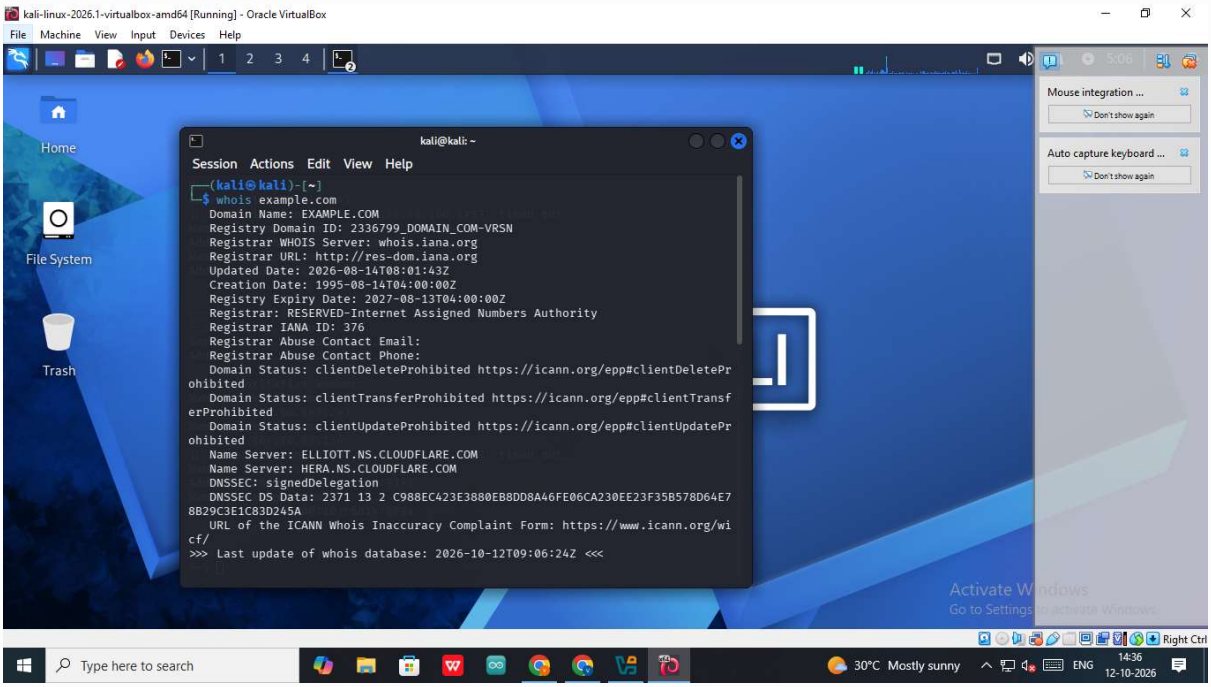

Commands/codes:

Input 1: WHO.IS reconnaissance using Kali Linux

Command:

```
whois example.com
```

Output 1 :

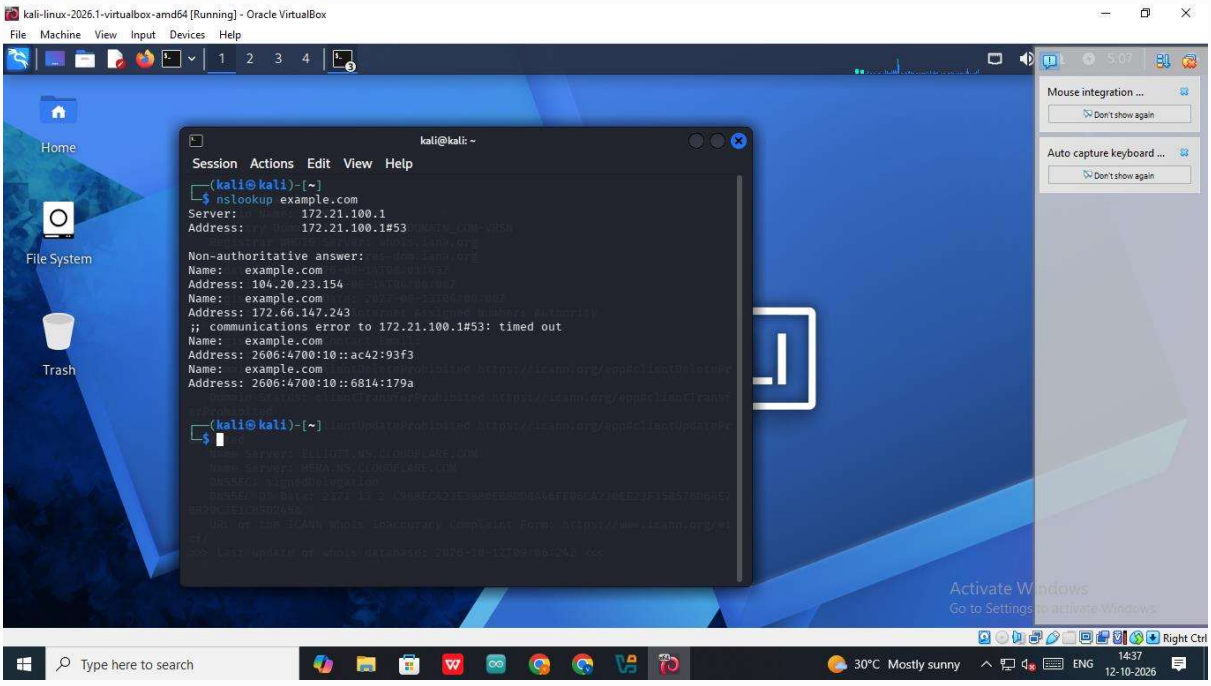

Input 2: DNS information using Kali Linux

Command:

```
nslookup example.com
```

Output 2 (illustrative):

Result

Reconnaissance was performed using Google Search and WHO.IS. Google Search was used to identify publicly indexed pages, while WHO.IS and the Kali Linux `whois` command were used to examine available domain registration information. The `nslookup` command was also used to inspect DNS information.
